

## System Testing and Continuous Integration Practice Practical 2 Part 2

### Practical Brief:

Next weeks practical will be marked as follows;

This practical consists of two parts:

Part 1: **Continuous Integration and unit testing** (15 marks)

Part 1a: Unit Testing (10 marks)

Part 1b: Continuous Integration (5 marks)

**Part 2: Selenium Testing (15 marks)**

**This is for part 2**

### Part 2 – Selenium Testing

You are required to implement Selenium testing for a Chrome Browser for the Grade Marking App application code provided on Moodle.

There is a zip file on moodle (room\_booking.zip) which contains;

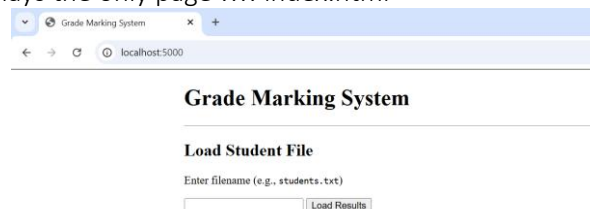

A python application file - app.py,

A sample text file containing sample student marks students.txt

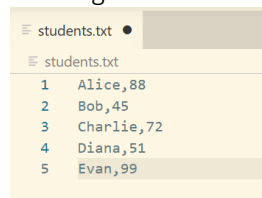

A templates folder for jinja2 template files

This is a simple grade marking application that has the following features:

url localhost:5000 -> displays the only page !!!! index.html

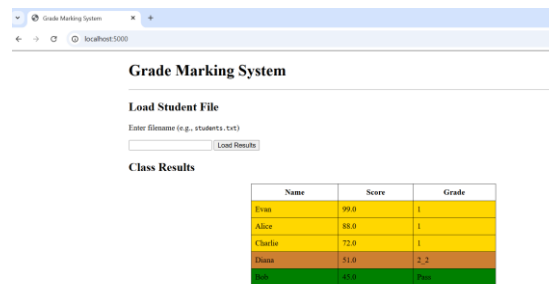

The sample file students.txt can be loaded using the load results button above

Producing something like;

## PRACTICAL 2 PART 2 PRACTICE

Feature Requirements:

The app will read the selected file and produce a table which will be colour coded based on the grade

|                       |                             |        |                        |
|-----------------------|-----------------------------|--------|------------------------|
| First Class Honour    | 70 or greater               | Gold   | rgba(255, 215, 0, 1)   |
| 2.1 class Honour      | 60 or greater, less than 70 | Silver | rgba(192, 192, 192, 1) |
| 2.2 class Honour      | Between 50 and 60           | Bronze | rgba(205, 127, 50, 1)  |
| Pass                  | Between 40 and 50           | Green  | rgba(0, 128, 0, 1)     |
| Fail                  | Less than 40                | Red    | rgba(128, 0, 0, 1)     |
| Other error condition |                             |        |                        |

You should create your own results.txt file so that you correctly test the app paying attention to the grade boundaries and invalid partitions.

Your Selenium testing should then verify the correct display of the page including

- Page title
- H1 text
- H2 text
- Table header text and colour
- Text and correct grade / background colour for each student result
